CHEMISTRY

(Honours Core)

Paper : CHE-HC-4036

(Physical Chemistry-IV)

Full Marks : 60

Time : Three hours

The figures in the margin indicate full marks for the questions.

1. Answer the following questions : 1×7=7

(a) The molar conductance Λ_{NaOAc}° and Λ_{HCl}° at infinite dilution in water at 25°C are 91.0 and 426.2 $S\text{cm}^2\text{mol}^{-1}$ respectively. To calculate Λ_{HOAc}° , the additional value required is

(i) Λ_{NaOH}°

(ii) Λ_{NaCl}°

(iii) $\Lambda_{H_2O}^{\circ}$

(iv) Λ_{KCl}°

(Choose the correct answer)

Contd.

- (b) Define specific conductance.
(c) What is Ostwald's Dilution Law ?
(d) The pH of an aqueous solution is 4. Its

$[OH^-]$ is

(i) 10

(ii) 10^{-4}

(iii) 10^{-10}

(iv) 10^{-14}

(Choose the correct answer)

- (e) Define Debye-Falkenhagen effect.
(f) Which of the following molecule would have zero dipole moment ?

(i) NH_3

(ii) *m*-dichlorobenzene

(iii) CH_3Cl

(iv) *p*-dichlorobenzene

(Choose the correct answer)

- (g) The relative permeability $\mu_r > 1$ stands for

(i) Paramagnetic solids

(ii) Diamagnetic solids

(iii) Ferromagnetic solids

(iv) None of the above

(Choose the correct answer)

2. Answer the following questions : $2 \times 4 = 8$

(a) Explain the variation of molar conductance with dilution for weak electrolyte.

(b) Name *two* types of concentration cells.

(c) How can dissociation constant of weak acid be determined from the measurement of conductance ?

(d) Differentiate between paramagnetic and diamagnetic substances in terms of magnetic permeability and magnetic susceptibility.

3. Answer **any three** questions from the following : $5 \times 3 = 15$

(a) What is meant by transport number of an ion ? How is it determined by moving boundary method ? $1 + 4 = 5$

(b) Explain saturated calomel electrode with the reactions when it is acting as anode and cathode as well.

(c) At 25 °C, the specific conductance of carefully distilled water is $58.0 \times 10^{-7} \text{ Sm}^{-1}$ and λ_m° values for H^+ and OH^- ions are 349.8×10^{-4} and $198.5 \times 10^{-4} \text{ Sm}^2 \text{ mol}^{-1}$ respectively. Calculate the ionic product of water at 25°C. [Assume that λ_m differs very little from λ_m°]

(d) Derive the relation between standard EMF and equilibrium constant of a cell reaction. The standard EMF of the cell

is 1.10 volts. Calculate the equilibrium constant of the cell reaction. Prove whether the reaction is feasible or not.

$$2+2+1=5$$

(e) What is magnetic susceptibility? Explain Gouy's method for the measurement of magnetic susceptibility.

$$1+4=5$$

4. Answer **any three** questions from the following: $10 \times 3 = 30$

(a) Discuss Debye-Hückel theory of strong electrolytes. Explain relaxation effect and electrophoretic effect. How can Debye-Hückel-Onsager equation be utilized in the determination of equivalent conductance at infinite dilution for strong electrolytes.

$$3+4+3=10$$

(b) Write the principle of conductometric titrations. Draw and explain the titration curves obtained in the conductometric titration of

(i) HCl with $NaOH$

(ii) CH_3COOH with $NaOH$

(iii) CH_3COOH with NH_4OH and

(iv) $AgNO_3$ with KCl

$$2+2+2+2=10$$

(c) Explain the construction and working of glass electrode for the determination of pH of a solution using this electrode. What are the limitations of a glass electrode?

$$8+2=10$$

(d) Derive Nernst equation for the measurement of EMF of an electrochemical cell.

Consider an electrochemical cell

- (i) Write the cell reaction
- (ii) Calculate the EMF of the cell
- (iii) Calculate ΔG° value of the cell reaction.

Given that $E^\circ_{Cd^{2+}|Cd} = -0.40V$

$$E^\circ_{Fe^{2+}|Fe} = -0.44V$$

Why does a cell stop working after some time? Explain with an example.

$$3+1+2+2+2=10$$

- (e) (i) What is molecular polarizability?
- (ii) Derive the Clausius-Mossotti equation.
- (iii) Define induced molar polarization.

(iv) Which of the following molecules obey Clausius-Mossotti equation?

$$2+5+1+2=10$$

(f) (i) How can you apply dipole moment of a molecule to calculate percentage ionic character of the molecule and to predict the shapes of molecules?

(ii) The dipole moment of $NH_3(g)$ is 1.46D and the bond angle HNH is 108° . Calculate the bond moment of the $N-H$ bond.

(iii) How do you explain that the dipole moment of ethylchloride is considerably larger than that of chlorobenzene?

$$6+2+2=10$$
